The present sequence represents a specifically claimed Apo B binding sit peptide which can be used as a component of a non-naturally occurring, receptor-competent low density lipoprotein (LDL) particle of the present invention. The LDL particle comprises at least 1 peptide component that has at least 1 binding site for an apo B protein receptor and at least 1 lipophilic substituent. Also described in the invention are peptides containing an apo B binding sequence with at least 70% identity with sequences: KAEYKNNHRH (1) or TTRLTRKRGLK (2), or their dimers. Non-naturally occurring, receptor-competent LDL particles are useful as: (1) drug-taygeting vectors for delivering anticancer drugs to cancer cells that express an apo B protein receptor, and (ii) additives for cell culture media especially as growth supplements. Non-naturally occurring,	Halbert GW, Owens MD, Baillie G; WPI; 1998-230637/20. WPI; 1998-11pid particle comprising peptide binding to apo B protein receptor - useful as, e.g. vector for delivering drugs to cancer cells that express this receptor. Oxidised low density lipoprotein; oxLDL; immunoassay; periaortitis, cardiovascular disease; coronary heart disease, pre-eclampsia,

```
The invention relates to peptides having affinity for oxidised low density lipoprotein (oxLDL), in cyclised or multimeric form. The peptide creation in an immunoassay to determine the presence, and optionally, creating the amount of antibodies in a sample, having affinity for oxLDL. The peptide is useful if or measuring the amount of creatiovascular diseases, and several other diseases, and several other diseases, other creatiovascular diseases, and several other diseases, other creation. The peptide of the invention is stable, can be considered easily without the need to isolate proteins from a patient's population of the invention is stable, can be creatived peptide p63 used in the invention sequence is human apoB-100

The peptide is useful in an immunoassay to determine the presence, and optionally, the amount of antibodies in a sample, having affinity for oxLDL. Preferably immobilised peptide is useful for measuring the amount of autoantibodies for oxLDL in a sample, especially a serum or plasma sample from a patient for evaluating the risk of coronary heart diseases, other cardiovascular diseases, and several other disorders such as periaorritis, pre-eclampsia, non-insulin-dependent diabetes and endothelial dysfunction. The peptide of the invention is stable, can be synthesised easily without the need to isolate proteins from a patient's blood, and has a long half-life. The present sequence is human apoB-100 derived peptide p244 used in the invention
                                                                                                                                                                                                                                       Human apolipoprotein B-100; apoB-100; very-low density lipoprotein; VI apolipoprotein; binding; in vivo transport; nucleic acid; binding dom nuclear localisation sequence; gene therapy; cancer; cystic fibrosis; non-small cell lung carcinoma; diabetes; arteriosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acid binding domain from apoB-100.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New peptide useful in enzyme immunoassays for detecting oxidized low density lipoprotein which is a marker of coronary heart disease and cardiovascular diseases, has affinity for oxidized low density
                                                                                                                                                                                                                                                                                                                                                                                                                                                           22-APR-1999

ApoB-100 is a major apoprotein component of very-low density lipoproteins (VLDL), intermediate density lipoprotein (IDL), low density lipoproteins (VLDL) and lipoprotein a. The present sequence can be used in the composition of the invention. The specification describes a composition that comprises LDL and apolipoproteins for the binding and in vivo transport of nucleic acids. The composition is used to deliver nucleic acids to eukaryotic cells, in vivo or in vitro, for expressing a therapeutc polypeptide or antisense molecule (or ribozyme). Specifically they are used for gene therapy of cancers (particularly non-small cell lung carcinoma), diabetes, cystic fibrosis and arteriosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Anti-coagulant; apolipoprotein B-100; apoB-100; metastatic spread; thromboplastin-mediated process; cancer; inhibitor; blood coagulation; anglogenesis; cellular differentiation; apoptosis; KRAD-14;

Peptide fragments of apo:lipo:protein B-100 with anticoagulant activity

Claim

60pp; English.

for treating or prev differentiation and

preventing coagulation, inhibiting angiogenesis, and apoptosis.

£#####555555555555555555555

This sequence is an example of the peptide of the invention. It has the CC formula (I), or their variants with one or more internal deletions, consertions or substitutions, while retaining anti-coagulant properties of CC apolipoprotein B-100 (apoB-100). Z1-KAO-XI-KKNKHHHS-X-T-Z2 [I) X1 = S or CC (aa); Z2 = the C terminus of the peptide, or 1-47 amino acids CC esparate or sequential treatment of cancer, particularly to prevent CC during or after surgery or in cases of heart attack, stroke etc.) and to CC inhibit angiogenesis, cellular differentiation or apoptosis. KRAD-14, CC factor VII on the surface of thromboplastion of the prothrombinase complex; and prevents activation of the prothrombinase complex; and prevents activation of the surface of thromboplastin and of platelets by thrombin. XX smaller than apoB-100, they act more quickly

CC The present sequence is that of human apolipoprotein B. This non-cell CC disgnostic targets for hepatocellular carcinoma (HCC). Such proteins characterised as the products of genes identified by expression microarray analysis of the proteins of genes identified by expression microarray analysis of compared to the proteins of the protein on-tumour tissue when compared to HCC crelates to the detection of HCC by assaying patient samples such as the proteins of the presence and level of specific HCC crelated proteins. A finding of elevated levels of one or more of these proteins in a patient sample indicates that the patient has HCC methods as canning methods that employ non-cell-associated and cell-associated conductions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 8

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    apolipoprotein B-100 (apoB-100). ApoB-100 is a major apoprotein component of very-low density lipoproteins (VLDL), intermediate density lipoprotein sequence can be used in the composition of the invention. The present apolipoproteins for the binding and in vivo cransport of nucleic acids. The composition is used to deliver nucleic acids to entaryotic cells, in cancers (particularly non-small cell lung carcinoma), diabetes, cystic fibrosis and arreviced seconds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 394 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                  This invention describes a novel method for the genetic treatment of hyperlipidemia by altering genes, in hepatocytes, for apoprotein (apo) B, E or Al. Low density lipoprotein (LDL) levels in the blood are reduced by altering an apo B gene (I) in a hepatocyte. The invention describes a method for the therapeutic and/or prophylactic method involving altering an apo B gene in hepatocytes by introducing the mutations Argi12Cys, Argi58Cys or Cysi58Arg and a method for ameliorating atheroscierosis by altering the apo Al gene in a hepatocyte so that the altered protein can dimerize. Altering expression of apo genes regulates levels of high and low density lipoprotein cholesterol. Altering expression of apo B, E and Al genes is used to treat or prevent atherosclerosis, coronary heart disease, Alzheimer's disease, hypobetalipoproteinemia, and dysbetalipoproteinemia. This sequence represents a fragment of the human Apo B protein described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 4; Page

                                      CC This sequence represents the human apoliporptoein B-100 (apoB-100). CC Fragments of this sequence can be used in the poptide of the invention, cc which has the formula (I), or their variants with one or more internal cc deletions, insertions or substitutions, while retaining anti-coagulant properties of apolipoprotein B-100 (apoB-100). 21-KAQ-X1-KKWKHRHS-X2-T-Z2 (I); X1 = S or Y; X2 = T or I; Z1 = the N terminus of the peptide, or 1-CC (T); X1 = S or Y; X2 = T or I; Z1 = the N terminus of the peptide, or 1-CC (T); X1 = S or Y; X2 = T or I; Z1 = the N terminus of the peptide, or 1-CC (T); X1 = S or Y; X2 = T or I; Z1 = the N terminus of the peptide, or 1-CC (T); X1 = S or Y; X2 = T or I; Z1 = the N terminus of the peptide, or 1-CC (T) and to processes, separate or sequential treatment of cancer, particularly to prevent metastatic spread. They are also used to inhibit thromboplastin-CC (e.g. during or after surgery or in cases of heart attack, stroke etc.) and to inhibit angiogenesis, cellular differentiation or apoptosis. KRAD-CC (T) which is active as such or as part of a 98-aa peptide, inhibits activation of the prothrombinase complexe; and prevents activation of the prothrombinase complexe; and prevents activation of the prothrombinase complexe; and prevents activation of the surface of thromboplastin and of platelets by thromboplastin and of platelets by thromboplastin. Since (I) are much to the content of the prothrombinase complexes; and prevents activation of the surface of thromboplastin. Since (I) are much to the content of the c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

The invention relates to a method of inhibiting infection of a cell by virus capable of formating a complex with lipoprotein. The method comprises of preventing formation of and altering conformation of the complex to cantibody to receptor or binding of lipoprotein complex to complex to call receptor. (CR), blocking CR using CC soluble lipoprotein receptor, or downregulating low density lipoprotein receptor, or downregulating low density lipoprotein complex between the lipoprotein complex between the lipoprotein and collipse to the cell, which is capable of inducing a conformational change of a virus-lipoprotein complex. Alternatively, the method involves protein and collipse to the cell, which is capable of inducing a conformational change of a virus-lipoprotein complex. Alternatively, the method involves conformational change collipse included in the LDL-receptor binding domain of apoBluo, or anti-apolipoprotein (apol Blu) antibody which binds to an epitope included in the ligand binding domain of apoBluo, or anti-collepse antibody which binds to an epitope included in LDL receptor binding domain of apoBluo, or anti-collepse antibody which binds to an epitope included in LDL receptor binding composition of apoB. The method also involves introducing a peptide comprising conservation of apoBluo, or anti-collepse included in the lipand binding domain of LDL receptor binding domain of apoBluo, or anti-collepse included in the lipand binding domain of LDL receptor binding domain of apoBluo, or anti-collepse included in the lipand binding domain of LDL receptor binding domain of apoBluo, or anti-collepse included in the lipand binding domain of LDL receptor binding domain of apoBluo, or anti-collepse included in the lipand binding domain of apoBluo, or anti-collepse a

                                                                                                                                                                                                                                                                            The invention discloses a composition comprising two or more isolated rat CC or human polynucleotides or a polynucleotide which represents a fragment, CC derivative or allelic variation of the nucleic acid sequence. Also CC claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence kit to perform the method, an array, a method for identifying an agent chat is differentially regulated in an animal subjected to pain and a compound that is differentially expressed in neuronal tissue of a first animal cc subjected to pain, a method for identifying an agent cc the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound which regulates the expression of the polynucleotide sequence cc the expression of a polynucleotide sequence which is differentially compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a compound that regulates the activity in an animal of one or more of the polypeptides given in the cc activity in an animal of one or more of the polypeptides given in the cc polypeptides or their antibodies. The polynucleotide or the compound that compound that set activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction confuring a polypeptides or their antibodies. The polynucleotide or the constriction confuring the one or more of the sequence presented is a human protein (shown in Table 2 of the specification, which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed cc ftra, who highed act sequences.
                                                                 Matches
                                                                                                                           Query Match
                                                                                                                                                                                                   Sequence 4561 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 1; Page; 1017pp; English.

 ABR40253;
                                                                                                                                                                                                                                                                       The invention comprises methods of detecting the presence or absence of at least one allelic variant of a polymorphic region of a gene associated with cardiovascular disease. The invention specifically relates to detecting the region of a cytochrome C oxidase subunit VID (COX6B) gene that is associated with high serum cholesterol, or the region of the N-acetylglucosaminyl transferase component glycosylphosphatidylinosicol-1 (GPI-1) gene that is associated with low serum high density lipoprotein (HDL). The methods of the invention are useful for detecting a predisposition to high serum cholesterol, low serum HDL and cardiovascular disease. The methods are also useful for elucidating pathological pathways, developing diagnostic assays and new drug therapies for such disorders. The present amino acid sequence represents a human protein that is associated with high serum cholesterol, low serum HDL and/or cardiovascular disease
                                                                                                                                                                                                                                            Sequence 4563
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; gene therapy; single nucleotide polymorphism; SNP; cytochrome C oxidase subunit VID; COX6B; high serum cholesterol; GPI-1; N-acetylglucosaminyl transferase component; cardiovascular disease; HDL; glycosylphosphatidylinositol-1; low serum high density lipoprotein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A; Molecule type: mRNA
A; Residues: 2169-2179 <HOS>
A; Note: the sequence shown represents the carboxyl end of apolipoprotein B-48
A; Note: two RNA species, 14.1kb and 7.5kb in length, were isolated from the human che encodes the 250K apoB-48; CAA encoding 2180-Gln is substituted by the stop codo

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence represents a specifically claimed Apo B binding site peptide which can be used as a component of a non-naturally occurring, receptor-competent low density lipoprotein (LDL) particle of the present invention. The LDL particle comprises at least 1 peptide component that has at least 1 binding site for an apo B protein receptor and at least 1 lipophilic substituent. Also described in the invention are peptides containing an apo B binding sequence with at least 70% identity with sequences: KAEYKONKHRH (1) or TRLTRKRGLK (2), or their dimers. Non-naturally occurring, receptor-competent LDL particles are useful as: (i) drug-targeting vectors for delivering anticancer drugs to cancer cells that express an apo B protein receptor, and (ii) additives for cell culture media especially as growth supplements. Non-naturally occurring,

Non-natural lipid particle comprising peptide binding to apo B protein receptor - useful as, e.g. vector for delivering drugs to cancer cells

WPI; 1998-230637/20.

Claim 12; Page 52; 73pp; English.

that express this receptor.

CC Site peptide analogue which can be used as a component of a non-
CC naturally occurring, receptor-competent low density lipoprotein (LDL)
CC particle of the present invention. The LDL particle comprises at least 1
CC peptide component that has at least 1 binding site for an apo B protein
CC receptor and at least 1 lipophilic substituent. Also described in the
CC invention are peptides containing an apo B binding sequence with at least
CC dimers. Non-naturally occurring, receptor-competent LDL particle save
CC useful as: (i) drug-targeting vectors for delivering anticancer drugs to
CC cancer cells that express an apo B protein receptor, and (ii) additives
CC cocurring, receptor-competent LDL particles are
CC cocurring, receptor-competent LDL particles do not require the complete
CC apo B sequence, which is large and tends to aggregate, to provide binding
CC affinity to an apo B protein receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT 2

   AAW96878-97 represent nuclear localisation signal sequence derived from human apolipoprotein B-100 (apoB-100). ApoB-100 is a major apoprotein component of very-low density lipoproteins (VLDL), intermediate density present sequence can be used in the composition of the invention. The specification describes a composition that comprises LDL and lipoprotein a. The apolipoproteins for the binding and in vivo transport of nucleic acids. The composition is used to deliver nucleic acids to eukaryotic cells, in cancers (particularly non-small cell lung carcinoma), diabetes, cystic fibrosis and arteriosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       뭐
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ş

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel ligand for binding a target biomolecule, which comprises a peptide having at least one sulphated or sulphonated amino acid and at least one amino acid chosen from neutral and positively charged amino acids. The novel ligands can be used for the treatment of e.g. tumours, rheumatoid arthritis, diabetic retinopathy and hypoxia. This sequence represents a heparin binding peptide relating to the
                                                                                                                                                                                                        Apo B 100 binding site peptide analogue peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (ETHZ-)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           invention are peptides containing an apo B binding sequence with at least 70% identity with sequences: KASYKNKHRH (1) or TRLTRKRGLK (2), or their dimers. Non-naturally occurring, receptor-competent LDL particles are useful as: (i) drug-targeting vectors for delivering anticancer drugs to cancer cells that express an apo B protein receptor, and (ii) additives for cell culture media especially as growth supplements. Non-naturally occurring, receptor-competent LDL particles do not require the complete apo B sequence, which is large and tends to aggregate, to provide binding affinity to an and protein receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a specifically claimed Apo B 100 binding site peptide analogue which can be used as a component of a non-naturally occurring, receptor-competent low density lipoprotein (LDL) particle of the present invention. The LDL particle comprises at least 1 peptide component that has at least 1 binding site for an apo B protein receptor and at least 1 lipophilic substituent. Also described in the
                                                                                                                                                                                                                                                                                                                                                                                                              Apo B; binding site; receptor; cancer; drug delivery; anticancer; growth supplement; non-natural lipid particle; low density lipoprotein; LDL; receptor component; apo B100 receptor site.
